Belief, Uncertainty, and Truth in Language Models

10/01

SEC

12:30 - 1:30 pm

Dr. Jacob Andreas

Pitch (7/10): Dr. Andreas maintains a consistent pitch through his speech. The reasoning for the 7 is for some variations within that from him making a humorous comment about what he works on “is a weird thing to be working on.” So overall it was good for the technical points he was touching on.

Rate (8/10): Dr. Andreas' rate was good for what is considered an educational speech. As he does vary between rate but stuck in the just about right zone… not sure what words per minute that is. This gave the needed context as well to those who weren’t as technical as he was.

Volume (6/10): Dr. Andreas used a consistent volume and projected his voice well. Really aside from that there weren't many examples I could think of variation though. He could benefit from slight increases in parts where he made humorous comments.

Pauses (9/10): Dr. Andreas did a great job at strategic pauses. There were a lot of thoughtful pauses such as in when he was speaking about how wildly used nlp models are used today and

giving a long pause after that to let it ruminate with the audience. Overall, he did an amazing job keeping the audience on their seats with this tactic.

Vocal Distractions (9/10): I didn't hear any vocal distractions during the speech. And the reasoning for 9/10 is I frankly believe there is no 10/10 (perfect). That is really it.

Vocal Variety (8/10): Dr. Andreas used a good amount of vocal variety in the overall scoring of his pitch, rate, volume, and pauses. The points where he could improve were in pitch and volume. As for rate and pauses, those were done well.

Enunciation (9/10): Dr. Andreas was very clear with his articulation for technical terms. His entire speech was precise and didn't ever seem like he didn't know what he was going to say next. This was important due to the fact that not being able to enunciate well for hard technical terms can make the speech distracting.

Facial Expression (6/10): Dr. Andreas displayed facial expressions, but were as animated as they possibly could be- no. He did smile a lot with this excitement for the advancement of ChatGPT but besides that the only real facial expressions were serious and happy with his smile not being able to generate more differences. With that it limits the range of emotions the audience can possibly think of.

Eye Contact (9/10): Dr. Andreas eye contact with the second speaker and audience was very good. In getting asked a question he would maintain eye contact with them and then from there spread it around the room in a controlled manner. This is something I aspire to do for my speech.

Gesture (8/10): His hand gestures such as his comment of leaping change in AI capabilities prove he has good experience in use. They are very natural feelings and don't feel overdone. But more unique gestures could help him improve for a unique flair in his speech giving.

Movement (7/10): His movement was very neutral in the sense of being able to have occasional shifts in posture for emphasizing certain points but didn't make any huge movements. He chose to mostly stay stationary. Inherently being an educational speech I did think this was appropriate for the given circumstance.

Body Language (9/10): His body language was very open which made it great for the given speech. There was no crossing of the arms and a sort of forward tilt/lean in the direction of the audience made it a very welcoming speech. This overall made it very engaging for the audience.
